The running code stops at `.readLine()` and waits. When you press Enter, the code continues and terminates the system.

NOTE The sbt shell is the shell in which you can run sbt compiled programs. After you have installed sbt, typing `sbt` in your command line starts an sbt shell. In it, you can (among other things) compile, build, test, and run your Scala, Java, and C/C++ programs.

2.2.6 The application

With all this background, you can now understand the whole picture, as shown in the following listing.

Listing 2.1 Complete wallet code

```
object WalletApp extends App {

  val guardian: ActorSystem[Int] = ActorSystem(Wallet(), "wallet")    ❶
  guardian ! 1                                                        ❷
  guardian ! 10                                                       ❷

  println("Press ENTER to terminate")
  scala.io.StdIn.readLine()
  guardian.terminate()
}

object Wallet {

  def apply(): Behavior.Receive[Int] =                                ❸
    Behaviors.receive { (context, message) =>
      context.log.info(s"received '$message' dollar(s)")
      Behaviors.same
    }
}
```

❶ Instantiates an actor

❷ Int-type messages sent to the actor

❸ Behavior that defines how the Wallet actor responds to each message
