For simplicity, the wallet now has neither a maximum value nor the ability to decrease, and it has a default value of zero as the initial `total`. The wallet has the following protocol available:

```
object WalletOnOff {

  sealed trait Command
  final case object Increase(amount: Int) extends Command
  final case object Activate extends Command
  final case object Deactivate extends Command

  ...
}
```

No input parameters are required to instantiate the wallet because it has no maximum value and zero is the default initial amount. You can instantiate it and send `Increase` messages in both states, deactivated and activated. Note that the default state is activated. The following snippet shows how to increase, deactivate, and activate the wallet:

```
object WalletOnOffApp extends App {

  val guardian: ActorSystem[WalletResume.Command] =
    ActorSystem(WalletOnOff(), "wallet-on-off")
  guardian ! WalletResume.Increase(1)           ❶
  guardian ! WalletResume.Deactivate            ❷
  guardian ! WalletResume.Increase(1)           ❸
  guardian ! WalletResume.Activate              ❹
  guardian ! WalletResume.Increase(1)           ❺
}
```

❶ Increases the amount in the wallet

❷ Deactivates the wallet

❸ The wallet doesn’t increase because it is deactivated.

❹ Activates the wallet

❺ Increases the amount in the wallet
