3.3.3 Registering users in the Natter API

The core of the code is quite straightforward. First, you read the username and password from the input, making sure to validate them both as you learnt in chapter 2, and then you calculate a fresh Scrypt hash of the password. Finally, store the username and hash together in the database, using a prepared statement to avoid SQL injection attacks. Navigate to the folder src/main/java/com/manning/apisecurityinaction/controller in your editor and create a new file `UserController.java`. Copy the contents of the next listing into the editor and save the new file.

Listing 3.2 Registering a new user

```
package com.manning.apisecurityinaction.controller;

import com.lambdaworks.crypto.*;
import org.dalesbred.*;
import org.json.*;
import spark.*;

import java.nio.charset.*;
import java.util.*;

import static spark.Spark.*;

public class UserController {
  private static final String USERNAME_PATTERN =
      "[a-zA-Z][a-zA-Z0-9]{1,29}";

  private final Database database;
```
