To connect to your API, you'll need to tell curl to trust your mkcert-signed certificate[7]. Depending on the version of curl you're using, you may need to first export the certificate in a different format that it can read. You can use keytool again to export the certificate in Privacy Enhanced Mail (PEM) format, which can be read by many tools:

```
$ keytool -exportcert -alias 1 \    #A
  -rfc -keystore localhost.p12 \    #B
   -storepass changeit -storetype PKCS12 \
   -file server.pem    #C
Certificate stored in file <server.pem>
```

#A mkcert uses the alias "1" by default
#B Use the -rfc option to export in PEM format
#C Store the exported certificate in the file server.pem

Finally, you can call your API (after restarting the server) using the –cacert option to curl to tell it to trust your certificate:

```
$ curl --cacert server.pem -i
[CA] -d '{"username":"demo","password":"password"}'
[CA] -H 'Content-Type: application/json'
https://localhost:4567/users
HTTP/1.1 201 Created
Date: Tue, 05 Feb 2019 15:43:46 GMT
Location: /users/demo
Content-Type: application/json
X-Content-Type-Options: nosniff
X-XSS-Protection: 1; mode=block
Cache-Control: private, max-age=0
