```
    "path": "/spaces/1/messages/1",
    "method": "DELETE",
    "id": 2,
    "time": "2019-02-06T17:22:55.266Z",
    "user": "demo"
  },
  {
    "path": "/spaces/1/messages/1",
    "method": "DELETE",
    "id": 2,
    "time": "2019-02-06T17:22:55.269Z",
    "user": "demo",
    "status": 403
  },
  {
    "path": "/logs",
    "method": "GET",
    "id": 3,
    "time": "2019-02-06T17:23:01.952Z"
  }
]
```

This style of log is a basic access log, that just logs the raw HTTP requests and responses to your API. It can be more revealing to log details that make more sense to your API, such as logging that a new user has been created with a given username rather than that a POST request occurred against the “users” endpoint and resulted in a 201-status response. Even a basic access log is extremely useful though.

EXERCISES

6. What secure design principle would indicate that audit logs should be managed by different users than the normal system
