authentication on all requests to the API that start with the /spaces URL path, so that the code looks like the following:

```
  before(userController::authenticate);
  before("/spaces",    #A
      userController::requireAuthentication);    #A
  post("/spaces",
      spaceController::createSpace);
  ..
```

#A Add the filter to require authentication here.

If you save the file and restart the server you can now see unauthenticated requests to create a space be rejected with a 401-error asking for authentication, as in the following example:

```
$ curl -i --cacert server.pem
[CA]-d '{"name":"test space","owner":"demo"}'
[CA]-H 'Content-Type: application/json'
https://localhost:4567/spaces
HTTP/1.1 401 Unauthorized
Date: Mon, 18 Mar 2019 14:51:40 GMT
WWW-Authenticate: Basic realm="/", charset="UTF-8"
Content-Type: application/json
X-Content-Type-Options: nosniff
X-XSS-Protection: 1; mode=block
Cache-Control: private, max-age=0
Strict-Transport-Security: max-age=31536000
Server:
Transfer-Encoding: chunked
```
