many permissions and they may (accidentally or deliberately) cause damage to the system. Too few permissions and they may try to work around the security of the system to get their job done.

> **DEFINITION** The ***principle of least authority***, also known as the ***principle of least privilege***, says that all users and processes in a system should be given only those permissions that they need to do their job.

Permissions will be granted to users in a new permissions table, which links a user to a set of permissions in a given social space. For simplicity, you'll represent permissions as a string of the characters r (read), w (write), and d (delete). Add the following table definition to the bottom of scheme.sql in your text editor and save the new definition. It must come after the spaces and users table definitions as it references them to ensure that permissions can only be granted for spaces that exist and real users.

```
CREATE TABLE permissions(
    space_id INT NOT NULL REFERENCES spaces(space_id),
    user_id VARCHAR(30) NOT NULL REFERENCES users(user_id),
    perms VARCHAR(3) NOT NULL,
    PRIMARY KEY (space_id, user_id)
);
GRANT SELECT, INSERT ON permissions TO natter_api_user;
```

We then need to make sure that the initial owner of a space gets given all permissions. You can update the `createSpace` method to grant all permissions to the owner in the same transaction that we create the space. Open
