that has read permission on that space. The next listing adds an operation to the SpaceController to allow this.

Open SpaceController.java in your editor and add the `addMember` method from listing 3.8 to the class. First, we validate that the permissions given match the `"rwd"` form that we have been using. If so, then we insert the permissions for that user into the `permissions` ACL table in the database.

Listing 3.8 Adding users to a space

```
public JSONObject addMember(Request request, Response
response) {
    var json = new JSONObject(request.body());
    var spaceId = Long.parseLong(request.params(":spaceId"));
    var userToAdd = json.getString("username");
    var perms = json.getString("permissions");

    if (!perms.matches("r?w?d?")) {    #A
      throw new IllegalArgumentException("invalid
permissions");
    }

    database.updateUnique(    #B
        "INSERT INTO permissions(space_id, user_id, perms) "
+
            "VALUES(?, ?, ?);", spaceId, userToAdd, perms);

    response.status(200);
    return new JSONObject()
        .put("username", userToAdd)
        .put("permissions", perms);
  }
```
