API Security lies at the intersection of several security disciplines, as shown in figure 1.2. The most important of these are the following three areas:

1. *Information security* (or *InfoSec*) is concerned with the protection of information over its full life-cycle from creation, storage, transmission, back-up, and eventual destruction.
2. *Network security* deals with both the protection of data flowing over a network, and prevention of unauthorized access to the network itself.
3. *Application security* (AppSec) ensures that software systems are designed and built to withstand attacks and misuse.

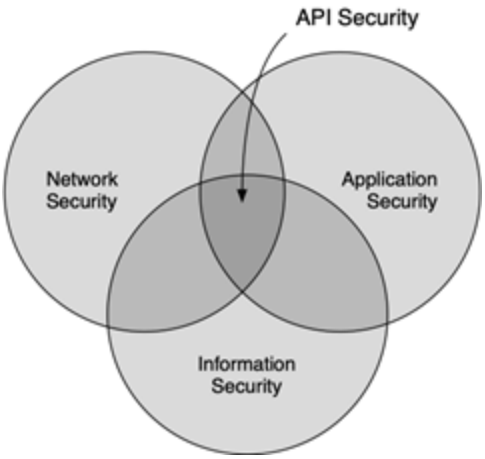

Figure 1.2 API security lies at the intersection of three security areas: network security, application security and information security.

Each of these three topics has filled many books individually, so we will not cover each of them in full depth.
