What happened here is that although the demo2 user was only granted read permission on the space, they could then use that read permission to add a new user that has full permissions on the space. This is known as a *privilege escalation*, where a user with lower privileges can exploit a bug to give themselves higher privileges.

> **DEFINITION** A ***privilege escalation*** (or *elevation of privilege*) occurs when a user with limited permissions can exploit a bug in the system to grant themselves or somebody else more permissions than they have been granted.

You can fix this in two general ways:

1. You can require that the permissions granted to the new user are no more than the permissions that are granted to the existing user. That is, you should ensure that evildemo2 is only granted the same access as the demo2 user.
2. You can require that only users with all permissions can add other users.
