To access the API, create a new folder named `public` in the Natter project, underneath the `src/main/resources` folder. Inside that new folder, create a new file called `natter.js` in your text editor and enter the code from listing 4.1 and save the file. The new file should appear in the project under `src/main/resources/public/natter.js`.

Listing 4.1 Calling the Natter API from JavaScript

```
const apiUrl = 'https://localhost:4567';

function createSpace(name, owner) {
    let data = {name: name, owner: owner};

    fetch(apiUrl + '/spaces', {    #A
        method: 'POST',
        credentials: 'include',
        body: JSON.stringify(data),    #B
        headers: {    #B
            'Content-Type': 'application/json'    #B
        }
    })
    .then(response => {
        if (response.ok) {    #C
            return response.json();    #C
        } else {    #C
            throw Error(response.statusText);    #C
        }
    })
    .then(json => console.log('Created space: ', json.name,
json.uri))
    .catch(error => console.error('Error: ', error));}
```

#A Use the Fetch API to call the Natter API endpoint
#B Pass the request data as JSON with the correct Content-Type
