So where did this come from? Because your JavaScript client did not supply a username and password on the REST API request, the API responded with a standard HTTP 401 Unauthorized status and a `WWW-Authenticate` header prompting for authentication using the Basic scheme. The browser understands the Basic authentication scheme, so it pops up a dialog box automatically to prompt the user for a username and password.

Create a user with the same name as the space owner using curl at the command line if you have not already created one, by running[1]

```
curl -H 'Content-Type: application/json' \
    -d '{"username":"test","password":"password"}'\
    https://localhost:4567/users
```

and then type in the name and password to the box and click Sign In. If you check the JavaScript Console you will see that the space has now been created.

If you now create another space, you will see that the browser doesn't prompt for the password again but that the space is still created. Browsers will remember HTTP Basic credentials and automatically send them on subsequent requests to the same URL path and to other endpoints on the same host and port that are siblings of the original URL. That is, if the password was originally sent to `https://api.example.com:4567/a/b/c`, then the browser will send the same credentials on requests to `https://api.example.com:4567/a/b/d` but would not send
