You can now wire up the `TokenController` to a real `TokenStore` implementation. Open the Main.java file in your editor and find the lines that create the `TokenController`. Replace the `null TokenStore` with an instance of the `CookieTokenStore` as follows:

```
TokenStore tokenStore = new CookieTokenStore();
var tokenController = new TokenController(tokenStore);
```

Save the file and restart the API. You can now try out creating a new session. First create a test user, if you have not done so already:

```
$ curl -H 'Content-Type: application/json' \
    -d '{"username":"test","password":"password"}' \
    https://localhost:4567/users
{"username":"test"}
```

You can then call the new `/sessions` endpoint, passing in the username and password using HTTP Basic authentication to get a new session cookie:

```
$ curl -i -u test:password \    #A
    -H 'Content-Type: application/json' \
    -X POST https://localhost:4567/sessions
HTTP/1.1 201 Created
Date: Sun, 19 May 2019 09:42:43 GMT
