```
<html>
<head>
    <title>Natter!</title>
    <script type="text/javascript" src="login.js"></script>
    <style type="text/css">
            input { margin-right: 100% }    #A
        </style>
</head>
<body>
<h2>Login</h2>
<form id="login">
    <label>Username: <input name="username" type="text"    #B
                            id="username">    #B
    </label>    #B
    <label>Password: <input name="password" type="password"
#C
                            id="password">    #C
    </label>    #C
    <button type="submit">Login</button>
</form>
</body>
</html>
```

#A As before, customize the CSS to style the form as you wish
#B The username field is a simple text field
#C Use a HTML password input field for passwords

4.5.1 Calling the login API from JavaScript

You can use the fetch API in the browser to make a call to the login endpoint, just as you did previously. Create a new file named login.js next to the login.html you just added and save the contents of listing 4.15 to the file. The listing adds
