#C Decode each part.
#D Find the cookie with the given name.

You can use this helper function to update the Create Space page to submit the CSRF-token with each request. Open the natter.js file in your editor and add the `getCookie` function. Then update the createSpace function to extract the CSRF token from the cookie and include it as an extra header on the request, as shown in listing 4.16. As a convenience, you can also update the code to check for a 401 response from the API request and redirect to the login page in that case. Save the file and rebuild the API and you should now be able to login and create a space through the UI.

Listing 4.16 Adding the CSRF token to requests

```
function createSpace(name, owner) {
    let data = {name: name, owner: owner};
    let csrfToken = getCookie('csrfToken');    #A

    fetch(apiUrl + '/spaces', {
        method: 'POST',
        credentials: 'include',
        body: JSON.stringify(data),
        headers: {
            'Content-Type': 'application/json',
            'X-CSRF-Token': csrfToken     #B
        }
    })
    .then(response => {
        if (response.ok) {
            return response.json();
        } else if (response.status === 401) {    #C
            window.location.replace('/login.html');    #C
        } else {
```
