introduced in chapter 2. Reading the token is also simple using a Dalesbred query. A helper method can be used to convert the JSON attributes back into a map to create the Token object. Dalesbred will call the method for the matching row (if one exists), which can then perform the JSON conversion to construct the real token. To revoke a token on logout, you can simply delete it from the database. Navigate to src/main/java/com/manning/apisecurityinaction/token and create a new file named DatabaseTokenStore.java. Type in the contents of listing 5.3 and save the new file.

Listing 5.3 The DatabaseTokenStore

```
package com.manning.apisecurityinaction.token;

import org.dalesbred.Database;
import org.json.JSONObject;
import spark.Request;

import java.security.SecureRandom;
import java.sql.*;
import java.util.*;

public class DatabaseTokenStore implements TokenStore {
    private final Database database;
    private final SecureRandom secureRandom;    #A

    public DatabaseTokenStore(Database database) {
        this.database = database;
        this.secureRandom = new SecureRandom();    #A
    }

    private String randomId() {
        var bytes = new byte[20];    #A
```
