revoke the token you simply hash the value provided by the user and use that to lookup the record in the database.

Listing 5.9 Hashing database tokens

```
@Override
public String create(Request request, Token token) {
    var tokenId = randomId();
    var attrs = new JSONObject(token.attributes).toString();

    database.updateUnique("INSERT INTO " +
        "tokens(token_id, user_id, expiry, attributes) " +
        "VALUES(?, ?, ?, ?)", hash(tokenId),
token.username,    #A
            token.expiry, attrs);

    return tokenId;
}

@Override
public Optional<Token> read(Request request, String tokenId)
{
    return database.findOptional(this::readToken,
            "SELECT user_id, expiry, attributes " +
            "FROM tokens WHERE token_id = ?",
hash(tokenId));    #A
}

@Override
public void revoke(Request request, String tokenId) {
    database.update("DELETE FROM tokens WHERE token_id = ?",
            hash(tokenId));     #A
}

private String hash(String tokenId) {    #B
    var hash = CookieTokenStore.sha256(tokenId);    #B
    return Base64url.encode(hash);    #B
```
