WARNING This code is not secure on its own because pure JSON tokens can be altered and forged. You'll add support for token authentication in section 6.1.1.

Listing 6.1 The JSON token store

```
package com.manning.apisecurityinaction.token;

import org.json.*;
import spark.Request;

import java.time.Instant;
import java.util.*;

import static java.nio.charset.StandardCharsets.UTF_8;

public class JsonTokenStore implements TokenStore {
    @Override
    public String create(Request request, Token token) {
        var json = new JSONObject();
        json.put("sub", token.username);    #A
        json.put("exp", token.expiry.getEpochSecond());    #A
        json.put("attrs", token.attributes);    #A

        var jsonBytes = json.toString().getBytes(UTF_8);
#B
        return Base64url.encode(jsonBytes);    #B
    }

    @Override
    public Optional<Token> read(Request request, String
tokenId) {
        try {
            var decoded = Base64url.decode(tokenId);    #C
            var json = new JSONObject(new String(decoded,
UTF_8));    #C
```
