To enable HMAC-protected tokens, open Main.java in your editor and change the code that constructs the `DatabaseTokenStore` to instead create a `JsonTokenStore`:

```
    TokenStore tokenStore = new JsonTokenStore();    #A
    tokenStore = new HmacTokenStore(tokenStore, macKey);
#B
    var tokenController = new TokenController(tokenStore);
```

#A Construct the JsonTokenStore.
#B Wrap it in a HmacTokenStore to ensure authenticity.

You can try it out to see your first stateless token in action:

```
$ curl -H 'Content-Type: application/json' -u test:password \
  -X POST https://localhost:4567/sessions
{"token":"eyJzdWIiOiJ0ZXN0IiwiZXhwIjoxNTU5NTgyMTI5LCJhdHRycyI
6e319.
[CA]INFgLC3cAhJ8DjzPgQfHBHvU_uItnFjt568mQ43V7YI"}
```

6.2 JSON Web Tokens

Authenticated client-side tokens have become very popular in recent years, thanks in part to the standardization of JSON Web Tokens in 2015. JWTs are very similar to the JSON tokens you have just produced, but have many more features:

- A standard header format that contains metadata about the JWT, such as which MAC or encryption algorithm was used.
