Each initial in the STRIDE acronym represents a class of threat to your API. General security mechanisms can effectively address each class of threat. For example, spoofing threats in which somebody pretends to be somebody else, can be addressed by requiring all users to authenticate. Many common threats to API security can be eliminated entirely (or at least significantly mitigated) by the consistent application of a few basic security mechanisms, as you'll see in chapter 3 and the rest of this book.

> **LEARN ABOUT IT** You can learn more about STRIDE, and how to identify specific threats to your applications, through one of many good books about threat modeling. I recommend Adam Shostack's *Threat Modeling: Designing for Security* (Wiley, 2014) as a good introduction to the subject.

EXERCISES

3. What do the initials CIA stand for when talking about security goals?
4. Which one of the following data flows should you pay most attention to when threat modeling?

a) Data flows within a web browser.

b) Data flows that cross trust boundaries.

c) Data flows between internal processes.

d) Data flows between external processes.
