- You can then create a `JWEHeader` object to specify the algorithm and encryption method.
- Finally, you encrypt the JWT using a `DirectEncrypter` object initialized with the AES key.

The `serialize()` method on the `EncryptedJWT` object will then return the JWE Compact Serialization. Navigate to src/main/java/com/manning/apisecurityinaction/token and create a new file name EncryptedJwtTokenStore.java. Type in the contents of listing 6.5 to create the new token store and save the file. As for the `JsonTokenStore`, leave the `revoke` method blank for now. You'll fix that in section 6.6.

Listing 6.6 The EncryptedJwtTokenStore

```
package com.manning.apisecurityinaction.token;

import com.nimbusds.jose.*;
import com.nimbusds.jose.crypto.*;
import com.nimbusds.jwt.*;
import spark.Request;

import javax.crypto.SecretKey;
import java.text.ParseException;
import java.util.*;

public class EncryptedJwtTokenStore implements TokenStore {

    private final SecretKey encKey;

    public JwtTokenStore(SecretKey encKey) {
        this.encKey = encKey;
    }

    @Override
```
