[1] This is a very famous example known as the ECB Penguin. You'll find the same example in many introductory cryptography books.

[2] I wrote Salty Coffee, reusing cryptographic code from Google's Tink library, to provide a simple pure Java solution. Bindings to libsodium are generally more secure and faster if you can use a native library.

[3] A nonce only needs to be unique and could be a simple counter. However, synchronizing a counter across many servers is difficult and error-prone so it's best to always use a random value.
