labels stored as an attribute of the token. For example, you might use the scope label `transactions:read` to allow read-access to transactions, and `payment:create` to allow setting up a new payment from an account. Because there may be more than one scope label associated with a token, they are often referred to as *scopes*. The scopes (labels) of a token collectively define the scope of access it grants. Figure 7.1 shows some of the scope labels available when creating a personal access token on GitHub.

> **DEFINITION** A ***scoped token*** limits the operations that can be performed with that token. The set of operations that are allowed is known as the ***scope*** of the token. The scope of a token is specified by one or more scope labels, which are often referred to collectively as ***scopes***.
