scope or resource owner cannot be established. Thankfully, most AS software generates sensible values for these fields.

Table 7.1 Token introspection response fields

Field	Description
`scope`	The scope of the token as a string. If multiple scopes are specified then they are separated by spaces, such as `"read_messages post_message"`.
`sub`	An identifier for the resource owner (subject) of the token. This is a unique identifier, not necessarily human-readable.
`username`	A human-readable username for the resource owner.
`client_id`	The ID of the client that requested the token.
`exp`	The expiry time of the token, in seconds from the UNIX epoch.

Listing 7.7 shows how to process the remaining JSON fields by extracting the resource owner from the `sub` field, the expiry time from the `exp` field, and the `scope` from the scope field. You can also extract other fields of interest, such as the `client_id`, which can be useful information to add to audit logs. Open OAuth2TokenStore.java again and add the `processResponse` method from the listing.

Listing 7.7 Processing the introspection response

```
private Optional<Token> processResponse(JSONObject response)
{
    var expiry =
Instant.ofEpochSecond(response.getLong("exp"));    #A
    var subject = response.getString("sub");    #A

    var token = new Token(expiry, subject);

    token.attributes.put("scope",
response.getString("scope"));    #A
```
