```
        var credentials = URLEncoder.encode(clientId, UTF_8)
+     #A
                ":" + URLEncoder.encode(clientSecret,
UTF_8);    #A
        var authorization = "Basic " + Base64.getEncoder()
#A

.encodeToString(credentials.getBytes(UTF_8));    #A

        var httpClient = HttpClient.newHttpClient();

        var form = "token=" + URLEncoder.encode(token, UTF_8)
+    #B
                "&token_type_hint=access_token";    #B

        var httpRequest = HttpRequest.newBuilder()
                .uri(revocationEndpoint)
                .header("Content-Type",
                    "application/x-www-form-urlencoded")
                .header("Authorization", authorization)    #C

.POST(HttpRequest.BodyPublishers.ofString(form))
                .build();

        httpClient.send(httpRequest,
BodyHandlers.discarding());
    }
}
```

#A Encode your client's credentials for Basic authentication.
#B Create the POST body using URL-encoding for the token.
#C Include your client credentials in the revocation request.
