authenticates the user and asks for consent for the client to be allowed access. Because this happens within a web browser, the AS typically creates a session cookie, so that the user does not have to login again.

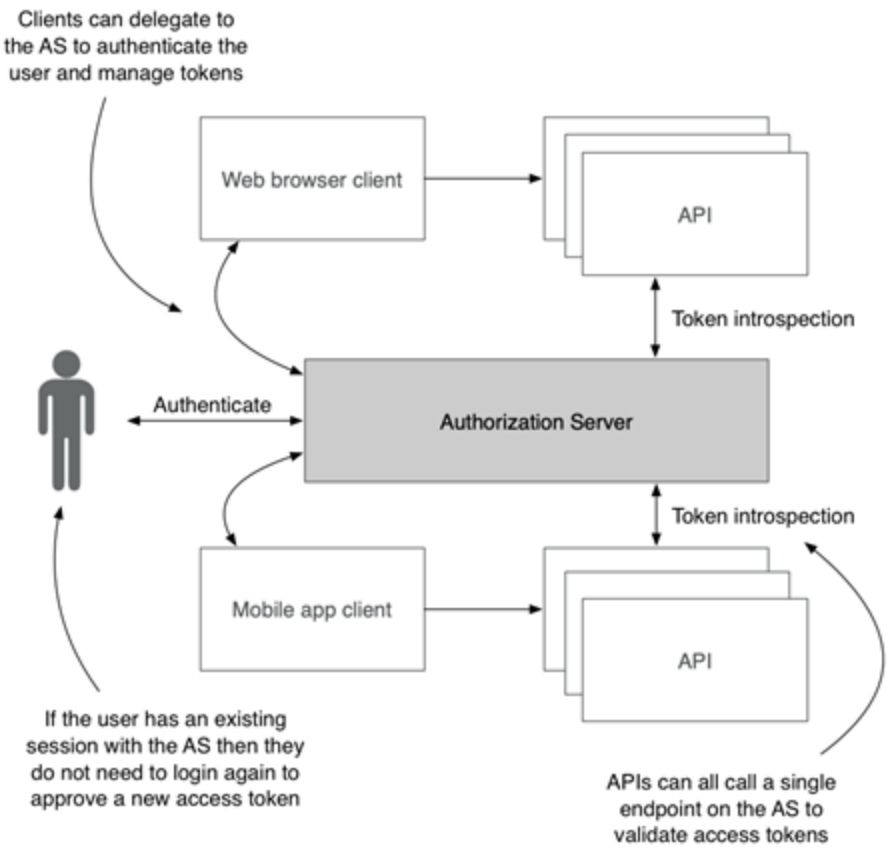

Figure 7.10 OAuth2 enables single sign-on for users. As clients delegate to the AS to get access tokens, the AS is responsible for authenticating all users. If the user has an existing session with the AS then they don’t need to be authenticated again, providing a seamless SSO experience.

If the user then starts using a different client, such as a different web application, they will be redirected to the AS
