

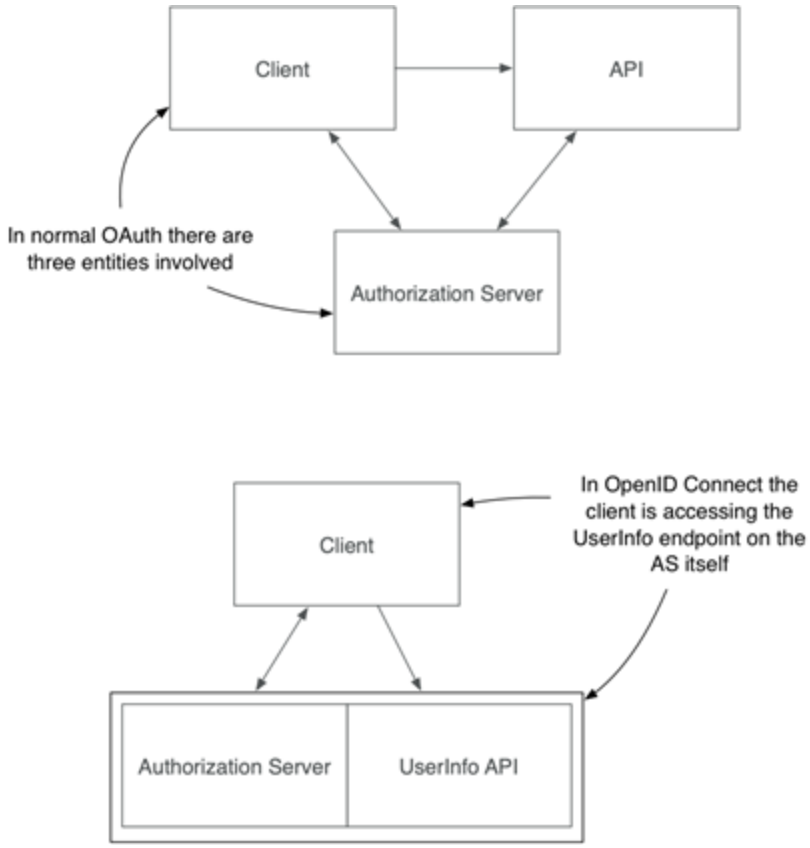

Figure 7.11 In OpenID Connect the client accesses APIs on the AS itself, so there are only two entities involved compared to the three in normal OAuth. The client is known as the Relying Party (RP), while the combined AS and API is known as an OpenID Provider (OP).

The most common use of OIDC is for a website or app to delegate authentication to a third-party identity provider. If you've ever logged into a website using your Google or Facebook account, you're using OIDC behind the scenes, and many large social media companies now support this.
