```
            "    ON rp.role_id = ur.role_id" +    #A
            " WHERE ur.space_id = ? AND ur.user_id = ?",
#A
            spaceId, username).orElse("");    #A
    request.attribute("perms", perms);    #B
}

public Filter requirePermission(String method, String
permission) {
    return (request, response) -> {
        if (!method.equals(request.requestMethod())) {
            return;
        }

        var perms = request.<String>attribute("perms");    #C
        if (!perms.contains(permission)) {
            halt(403);
        }
    };
}
```

#A Determine user permissions by mapping user to role to permissions.
#B Store permissions in a request attribute.
#C Retrieve permissions from the request before checking.

You now need to add calls to the new filter to ensure permissions are looked up. Open the Main.java file and add the following lines to the `main` method, before the definition of the `postMessage` operation:

```
before("/spaces/:spaceId/messages",
    userController::lookupPermissions);
before("/spaces/:spaceId/messages/*",
    userController::lookupPermissions);
```
