about writing Drools rules on the https://drools.org website or from the book *Mastering JBoss Drools 6* (Packt, 2016).

Listing 8.13 An example ABAC rule

```
package com.manning.apisecurityinaction.rules;    #A

import com.manning.apisecurityinaction.controller.
[CA]DroolsAccessController.*;    #A
import com.manning.apisecurityinaction.controller.
[CA]ABACAccessController.Decision;    #A

global Decision decision;    #B

rule "deny moderation outside office hours"    #C
    when    #C
        Action( this["method"] == "DELETE" )    #D
        Environment( this["timeOfDay"].hour < 9     #D
            || this["timeOfDay"].hour > 17 )    #D
    then    #C
        decision.deny();    #E
end
```

#A Add package and import statements just like Java.
#B Declare the decision global variable.
#C A rule has a description, a when section with patterns, and a then section with actions.
#D Patterns match the attributes.
#E The action can call the permit or deny methods on the decision.

Now that you have written an ABAC rule you can wire up the main method to apply your rules as a Spark `before()` filter that runs before the other access control rules. The filter will call the `enforcePolicy` method inherited from the
