2.1.3 Setting up the project

Use Maven to generate the basic project structure, by running the following command in the folder where you want to create the project:

```
mvn archetype:generate \
[CA] -DgroupId=com.manning.apisecurityinaction \
[CA] -DartifactId=natter-api \
[CA] -DarchetypeArtifactId=maven-archetype-quickstart \
[CA] -DarchetypeVersion=1.4 -DinteractiveMode=false
```

If this is the first time that you've used Maven, it may take some time as it downloads the dependencies that it needs. Once it completes, you'll be left with the following project structure, containing the initial Maven project file (pom.xml), and an `App` class and `AppTest` unit test class under the required Java package folder structure.

```
natter-api
├── pom.xml #A
└── src
├── main
│ └── java
│ └── com
│ └── manning
│ └── apisecurityinaction
│ └── App.java #B
└── test
└── java
└── com
└── manning
└── apisecurityinaction
```
