because there will be no other way for a user to recover access to a social space. You'll learn ways to add expiry times and other restrictions to capabilities in section 9.3.

Listing 9.1 Generating capability URIs

```
package com.manning.apisecurityinaction.controller;
import java.net.URI;
import java.time.Instant;
import java.util.Objects;
import
com.manning.apisecurityinaction.token.SecureTokenStore;
import
com.manning.apisecurityinaction.token.TokenStore.Token;
import spark.*;
public class CapabilityController {
private final SecureTokenStore tokenStore; #A
public CapabilityController(SecureTokenStore tokenStore) { #A
this.tokenStore = tokenStore; #A
}
public URI createUri(Request request, String path, String
perms) {
var token = new Token(Instant.MAX, null); #B
token.attributes.put("path", path); #C
token.attributes.put("perms", perms); #C
var tokenId = tokenStore.create(request, token);
var uri = URI.create(request.url());
return uri.resolve(path + "?access_token=" + tokenId); #D
}
}
```

#A Use an existing SecureTokenStore to generate tokens.
#B Leave the username null when creating the token.
#C Encode the resource path and permissions into the token.
