to implement the `GeneralCaveatVerifier` interface, which allows you to implement arbitrary conditions to satisfy a caveat. Listing 9.18 shows an example verifier to check that the `since` query parameter to the `findMessages` method is after a certain time, allowing you to restrict a client to only view messages since yesterday. Open the MacaroonTokenStore.java file again and add the contents of listing 9.18 as an inner class. You can then add the new verifier to the `read` method by adding the following line,

```
verifier.satisfyGeneral(new SinceVerifier(request));
next to the lines adding the other caveat verifiers.
```

Listing 9.18 A custom caveat verifier

```
private static class SinceVerifier implements
GeneralCaveatVerifier {
private final Request request;
private SinceVerifier(Request request) {
this.request = request;
}
@Override
public boolean verifyCaveat(String caveat) {
if (caveat.startsWith("since > ")) { #A
var minSince = Instant.parse(caveat.substring(8)); #A
var reqSince = Instant.now().minus(1, ChronoUnit.DAYS); #B
if (request.queryParams("since") != null) { #B
reqSince = Instant.parse(request.queryParams("since")); #B
}
return reqSince.isAfter(minSince); #C
}
return false; #D
}
}
```
