```
import java.nio.file.*;
import org.dalesbred.*;
import org.h2.jdbcx.*;
import org.json.*;
public class Main {
public static void main(String... args) throws Exception {
var datasource = JdbcConnectionPool.create( #A
"jdbc:h2:mem:natter", "natter", "password"); #A
var database = Database.forDataSource(datasource);
createTables(database);
}
private static void createTables(Database database)
throws Exception {
var path = Paths.get( #B
Main.class.getResource("/schema.sql").toURI()); #B
database.update(Files.readString(path)); #B
}
}
```

#A Create a JDBC DataSource object for the in-memory database.
#B Load table definitions from schema.sql.

2.2 Developing the REST API

Now that you've got the database in place, you can start to write the actual REST APIs that use it. You'll flesh out the implementation details as we progress through the chapter, learning secure development principles as you go.

Rather than implement all your application logic directly within the `Main` class, you'll extract the core operations into several *controller* objects. The `Main` class will then define mappings between HTTP requests and methods on these controller objects. In chapter 3, you will add several security
