configuration, which is almost identical to the H2 database deployment you created in the last section. Apart from specifying a different Docker image to run, you should also make sure you attach a different label to the pods that form this deployment. Otherwise the new pods will be included in the database deployment. Create a new file named natter-api-deployment.yaml in the kubernetes folder with the contents of the listing.

Listing 10.7 The Natter API deployment

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: natter-api-deployment    #A
  namespace: natter-api
