required for a HTTP 201 response, you will set the URI of the newly created space in the Location header of the response.

Navigate to the Natter API project you created and find the src/main/java/com/manning/apisecurityinaction folder. Create a new sub-folder named “controller” under this location. Then open your text editor and create a new file called SpaceController.java in this new folder. The resulting file structure should look as follows, with the new items highlighted in bold:

```
natter-api
├── pom.xml
└── src
├── main
│ └── java
│ └── com
│ └── manning
│ └── apisecurityinaction
│ ├── Main.java
│ └── controller
│ └── SpaceController.java
└── test
└── …
```

Open the SpaceController.java file in your editor again and type in the contents of listing 2.4 and click Save. The code as written contains a serious security vulnerability, known as an *SQL injection vulnerability*. You’ll fix that in section 2.4. I’ve marked the broken line of code with a comment, to make sure you don’t accidentally copy this into a real application.
