```
            handleException(int status) {    #D
        return (ex, request, response) -> {    #D
            logger.error("Caught error {} - returning status
{}",    #D
                ex, status);    #D
            response.status(status);    #D
            response.body(new JSONObject()    #D
                .put("status", status).toString());    #D
        };
    }
}
```

#A Because this service will only be called by other services you can omit the browser security headers
#B Extract metadata properties from the HTML
#C Produce a JSON response, taking care with attributes that might be null
#D Return appropriate HTTP status codes if jsoup raises an exception

10.2.5 Deploying the new microservice

To deploy the new microservice to Kubernetes, you need to first build the link-preview microservice as a Docker image, and then create a new Kubernetes deployment and service configuration for it. You can reuse the existing jib-maven-plugin the build the Docker image, overriding the image name and main class on the command line. Open a terminal in the root folder of the Natter API project and run the following commands to build the image to the minikube Docker daemon:
