```
          image: apisecurityinaction/link-preview-
service:latest    #B
          imagePullPolicy: Never
          securityContext:
            allowPrivilegeEscalation: false
            readOnlyRootFilesystem: true
            capabilities:
              drop:
                - all
          ports:
            - containerPort: 4567
```

#A Give the pods the name link-preview-service
#B Use the link-preview-service Docker image you just built

Run the following command to create the new deployment:

```
kubernetes apply -f \
  kubernetes/natter-link-preview-deployment.yaml
```

To allow the Natter API to locate the new service, you should also create a new Kubernetes service configuration for it. Listing 10.11 shows the configuration for the new service, selecting the pods you just created and exposing port 4567 to allow access to the API. Create the file kubernetes/natter-link-preview-service.yaml with the contents of the new listing.

Listing 10.11 The link preview service configuration

```
apiVersion: v1
kind: Service
metadata:
```
