#B Send each link to the link-preview service
#C If it was valid then add the link preview to the links list in the message

You can now rebuild the Docker image by running the following command in a terminal in the root folder of the project:

```
eval $(minikube docker-env)
mvn clean compile jib:dockerBuild
```

Because the image is not versioned, minikube won't automatically pick up the new image. The simplest way to use the new image is to restart minikube, which will reload all the images from the Docker daemon[3]:

```
minikube stop
minikube start
```

You can now try out the link-preview service. First create a user:

```
curl http://$(minikube ip):30567/users \
  -H 'Content-Type: application/json' \
  -d '{"username":"demo","password":"password"}'
{"username":"demo"}
```

Next, create a social space and extract the message read-write capability URI into a variable:
