TIP You can create an alias for the minikube IP address in the /etc/hosts file on Linux or MacOS by running the command

```
sudo sh -c "echo '$(minikube ip)  api.natter.local' >>
[CA]/etc/hosts"
```

On Windows, create or edit the file under C:\Windows\system32\etc\hosts and add a line with the IP address a space and the hostname. You can then make curl calls to http://api.natter.com:30567 rather than using the IP address.

Listing 10.17 Validating the Host header

```
var expectedHostNames = Set.of(    #A
        "api.natter.com",     #A
        "api.natter.com:30567",    #A
        "natter-link-preview-service:4567",    #A
        "natter-link-preview-service.natter-api:4567",    #A
        "natter-link-preview-service.natter-
api.svc.cluster.local:4567");
before((request, response) -> {    #B
    if (!expectedHostNames.contains(request.host())) {    #B
        halt(400);    #B
    }    #B
});    #B
```

#A Define all valid hostnames for your API.
#B Reject any request that doesn’t match one of the set.
