You can force a restart of each deployment in the namespace by running the following commands:

```
kubectl rollout restart deployment \
  natter-database-deployment -n natter-api
kubectl rollout restart deployment \
  natter-link-preview-service-deployment -n natter-api
kubectl rollout restart deployment \
  natter-api-deployment -n natter-api
```

Listing 10.18 Enabling Linkerd

```
apiVersion: v1
kind: Namespace
metadata:
  name: natter-api
  labels:
    name: natter-api
  annotations:     #A
    linkerd.io/inject: enabled    #A
```

#A Add the linkerd annotation to enable the service mesh

For HTTP APIs, such as the Natter API itself and the link-preview microservice, this is all that is required to upgrade those services to HTTPS when called from other services within the service mesh. You can verify this by using the Linkerd `tap` utility, which allows for monitoring network connections in the cluster. You can start tap by running the following command in a new terminal window:

```
linkerd tap ns/natter-api
```
