b. Audit logging
c. Load balancing
d. Terminating TLS requests
e. Implementing business logic
f. Securing database connections

Answers follow.

## *ANSWERS TO EXERCISES*

1. c - Pods are made up of one or more containers.
2. False. A sidecar container runs alongside the main container. An init container is the name for a container that runs before the main container.
3. a, b, c, d, and f are all good ways to improve the security of containers.
4. e - You should prefer strict whitelisting of URLs whenever possible.
5. d and e. Keeping the root CA key offline reduces the risk of compromise and allows you to revoke and rotate intermediate CA keys without rebuilding the whole cluster.
6. True - a service mesh can automatically handle most aspects of applying TLS to your network requests.
7. a, b, c, and d.

## 10.5 Summary

- Kubernetes is a popular way to manage a collection of microservices running on a shared cluster. Microservices are deployed as pods, which are groups
