The ROPC grant type may be deprecated or removed in future versions of OAuth.

The main downside of service accounts is the requirement for the client to manage two sets of credentials, one as an OAuth2 client and one for the service account. This can be eliminated by arranging for the same credentials to be used for both. Alternatively, if the client doesn't need to use features of the AS that require client credentials it can be a public client and use only the service account credentials for access.

POP QUIZ

Answers are at the end of the chapter.

1. Which of the following are differences between an API key and a user authentication token?

a) API keys are more secure than user tokens.

b) API keys can only be used during normal business hours.

c) A user token is typically more privileged than an API key.

d) An API key identifies a service or business rather than a user.

e) An API key typically has a longer expiry time than a user token.

2. Which one of the following grant types is most easily used for authenticating a service account?
