#A Load the key pair as a JWK
#B Output the public key as a JWK Set

Once you've registered the JWK Set with the AS, you should then be able to generate an assertion and use it to authenticate to the AS to obtain an access token. Listing 11.2 shows how to format the client credentials request with the client assertion and send it to the AS as a HTTPS request. The JWT assertion is passed as a new `client_assertion` parameter, and the `client_assertion_type` parameter is used to indicate that the assertion is a JWT by specifying the value

```
urn:ietf:params:oauth:client-assertion-type:jwt-bearer
```

The encoded form parameters are then POSTed to the AS token endpoint.

Listing 11.2 Sending the request to the AS

```
var form = "grant_type=client_credentials&scope=a+b+c" +
#A
        "&client_assertion_type=" +    #A
"urn:ietf:params:oauth:client-assertion-type:jwt-bearer" +
    #A
        "&client_assertion=" + assertion;    #A

var httpClient = HttpClient.newHttpClient();    #B
var request = HttpRequest.newBuilder()    #B
        .uri(URI.create(as))    #B
        .header("Content-Type", "application/x-www-form-
urlencoded")    #B
        .POST(HttpRequest.BodyPublishers.ofString(form))
#B
```
