```
    var username = credentials[0];
    var password = credentials[1];

    var hash = database.findOptional(String.class,
            "SELECT pw_hash FROM users WHERE user_id = ?",
username);

    if (hash.isPresent() && SCryptUtil.check(password,
hash.get())) {
        request.attribute("subject", username);

        var groups = database.findAll(String.class,
            "SELECT DISTINCT group_id FROM group_members " +
                   "WHERE user_id = ?", username);
        request.attribute("groups", groups);
    }
}
```

#A If certificate authentication was successful then use the supplied certificate
#B Otherwise use the existing password-based authentication

You can now rebuild the Natter API service by running

```
eval $(minikube docker-env)
mvn clean compile jib:dockerBuild
```

in the root directory of the Natter project. Then restart the Natter API and database to pick up the changes,[3] by running:

```
kubectl rollout restart deployment \
```
