You get one of those terrible 500 internal server error responses. If you look at the server logs, you can see why:

```
org.h2.jdbc.JdbcSQLException: Syntax error in SQL statement
"INSERT INTO spaces(space_id, name, owner) VALUES(4,
'test'space', 'demo[*]');";
```

The single quote you included in your input has ended up causing a syntax error in the SQL expression. What the database sees is the string `'test'`, followed by some extra characters (“space”) and then another single quote. Because this is not valid SQL syntax, it complains and aborts the transaction. But what if your input ends up being valid SQL? In that case the database will execute it without complaint. Let’s try running the following command instead:

```
$ curl -i -d "{\"name\": \"test\",\"owner\":
[CA] \"'); DROP TABLE spaces; --\"}"
http://localhost:4567/spaces
HTTP/1.1 201 Created
Date: Wed, 30 Jan 2019 16:51:06 GMT
Location: /spaces/9
Content-Type: application/json
Transfer-Encoding: chunked
Server: Jetty(9.4.8.v20171121)
{"name":"', ''); DROP TABLE spaces; --","uri":"/spaces/9"}
```

The operation completed successfully with no errors, but let’s see what happens when you try to create another space:

```
$ curl -d '{"name": "test space", "owner": "demo"}'
```
