```
var dbPassword =
Files.readString(secretsPath.resolve("password"));    #A

var jdbcUrl = "jdbc:h2:tcp://natter-database-
service:9092/mem:natter";
var datasource = JdbcConnectionPool.create(
    jdbcUrl, dbUsername, dbPassword);    #B
createTables(datasource.getConnection());
```

#A Load secrets as files from the filesystem
#B Use the secret values to initialize the JDBC connection

You can rebuild the Docker image by running

```
eval $(minikube docker-env)
mvn clean compile jib:dockerBuild
```

then re-load the deployment configuration to ensure the secret is mounted:

```
kubectl apply -f kubernetes/natter-api-deployment.yaml
```

Finally, you can restart minikube to pick up the latest changes:

```
minikube stop && minikube start
```

Use `kubectl get pods -n natter-api --watch` to verify that all pods start up correctly after the changes.
