`"AuthService")`, while the key for a client named “Test” to talk to the auth service is calculated as `KDF(KDF(masterKey, "AuthService"), "Test")`. This allows Facebook to quickly generate an almost unlimited number of client and service keys from the single master key. You can read more about Facebook’s CATs at https://eprint.iacr.org/2018/413.

POP QUIZ

Answers at the end of the chapter.

12. Which HKDF function is used to derive keys from a HMAC master key?

a) HKDF-Extract

b) HKDF-Expand

c) HKDF-Extrude

d) HKDF-Exhume

e) HKDF-Exfiltrate

11.6 Service API calls in response to user requests

When a service makes an API call to another service in response to a user request, but uses its own credentials rather than the user’s, there is an opportunity for confused deputy attacks like those discussed in chapter 9. Because service credentials are often more privileged than normal
