```
CREATE USER natter_api_user PASSWORD 'password';
GRANT SELECT, INSERT ON spaces, messages TO natter_api_user;
```

We then need to update our `Main` class to switch to using this restricted user after the database schema has been loaded. Note that we cannot do this before the database schema is loaded, otherwise we would not have enough permissions to create the database! We can do this by simply reloading the JDBC `DataSource` object after we have created the schema, switching to the new user in the process. Locate and open the Main.java file in your editor again and navigate to the start of the `main` method where you initialize the database. Change the few lines that create and initialize the database to the following lines instead:

```
var datasource = JdbcConnectionPool.create( #A
"jdbc:h2:mem:natter", "natter", "password"); #A
var database = Database.forDataSource(datasource); #A
createTables(database); #A
datasource = JdbcConnectionPool.create( #B
"jdbc:h2:mem:natter", "natter_api_user", "password"); #B
database = Database.forDataSource(datasource); #B
```

#A Initialize the database schema as the privileged user.
#B Switch to the natter_api_user and recreate the database objects.

Here you create and initialize the database using the “natter” user as before, but you then recreate the JDBC connection pool `DataSource` passing in the username and password of your newly created user. In a real project, you should be using more secure passwords than “password”,
