```
String query =
"SELECT msg_text FROM messages WHERE author = '"
+ author + "'"
```

and the following `author` input value supplied by an attacker:

```
john' UNION SELECT password FROM users; --
```

what will be the output of running the query (assuming that the `users` table exists with a `password` column)?

a) Nothing.

b) A syntax error.

c) John’s password.

d) The passwords of all users.

e) An integrity constraint error.

f) The messages written by John.

g) Any messages written by John and the passwords of all users.

2.5 Input validation

Security flaws often occur when an attacker can submit inputs that violate your assumptions about how the code should operate. For example, you might assume that an input can never be more than a certain size. If you’re using
