handler function can then use the response object to produce an appropriate error message. In this case, you will catch `IllegalArgumentException` thrown by our validation code, and `JSONException` thrown by the JSON parser when given incorrect input. In both cases, you can use a helper method to return a formatted 400 Bad Request error to the user. You can also return a 404 Not Found result when a user tries to access a space that doesn't exist by catching Dalesbred's `EmptyResultException`.

Listing 2.9 Handling exceptions

```
import org.dalesbred.result.EmptyResultException; #A
import spark.*; #A
public class Main {
public static void main(String... args) throws Exception {
..
exception(IllegalArgumentException.class, #B
Main::badRequest);
exception(JSONException.class, #C
Main::badRequest);
exception(EmptyResultException.class, #D
(e, request, response) -> response.status(404)); #D
}
private static void badRequest(Exception ex,
Request request, Response response) {
response.status(400);
response.body("{\"error\": \"" + ex + "\"}");
}
..
}
```

#A Add required imports.
